

Future networks in the age of 6G and AI

Future Media Townhall Panel: *AI for Media and Future Networks*

Saba Ahsan

Principal Research Lead at Nokia

Network traffic is transforming

1

Consumer, enterprise and industrial AI traffic is growing

AI is the baseline expectation of premium devices. 45% of operators now regard AI monetization as a strategic priority. 40% enterprise software will have AI components in 2026.

2

Video still 75% of mobile traffic but no longer the full story

AI indirect consumer traffic generated by AI recommendation engines. IoT, immersive media increasing uplink heavy, interactive experiences.

3

AI becomes a material traffic class within a decade

AI traffic is the fastest-growing traffic category, ($\approx 23\%$ CAGR vs $\approx 15\%$ for non-AI traffic through 2034).

4

AI is changing traffic character, not just volume

9% of AI inference flows upstream-heavy versus 0.5% of typical web flow. AI inference flows lasting roughly 2× longer, with web flows having a 10× higher median rate

5

AI systems generate traffic autonomously, respond at machine speed

Agents multiply one human request into machine-speed exchanges. Nokia forecasts 37% of AI traffic will be machine generated by 2034.

Media changes from predictable downlink streaming → interactive, uplink-intensive, AI-driven.

6G is AI Native

The dual paradigm

AI for 6G

- AI-native network optimization
- Autonomous operations & assurance
- AI-driven experience optimization

Case Study: **Nokia MantaRay AutoPilot** at Hajj

- handled a 40% traffic increase
- about 10,000 autonomous corrective actions/hour
- improved average downlink throughput by 10%

6G for AI

Networks carry AI workflows

Distributed AI compute and inference, machine-latency, visual uploads

New traffic patterns, improved QoE

From Pixels to AI-Native Media

NOKIA Connecting
