L3D-DASH: Low Latency Low Delay DASH

Fraunhofer FOKUS

Low latency and low delay with the protocol you already run

WHAT IS IT?

MPEG-DASH 6th edition adds **Segment Sequence Representations** : short partial segments plus a bootstrap representation.

WHAT DID WE DO?

- Implemented L3D-DASH and investigated latency, stability and startup times
- Setup: Atime encoder and packager, plain MSE player and dash.js.

LOW DELAY STARTUP

≈ ½ the time to first frame

partial vs full segment on a Samsung phone; download times excluded

1.5 – 2 s

stable latency, encoder to player

WHAT ARE WE WORKING ON?

AV1 S-Frame switching — a switch point at roughly P-frame cost, no IDR. Every partial segment becomes a switch point without the encoding overhead.

Joint project with Netflix, live demo at the **Fraunhofer booth: Hall 8, booth B80**
