Video Interoperability Profiles

Video capabilities and operation points of 3GPP TS 26.265, and the conformance validator for them

3GPP

OCTOBER 2026 – www.5g-mag.com

LEARN

About the project

What 3GPP TS 26.265 defines, and the part the validator comes from

Video capabilities

Part of 3GPP TS 26.265

Service-independent video decoding and encoding capabilities, which 3GPP service specifications and third-party services may reference.

Operation points

Part of 3GPP TS 26.265

Combinations of a video coding format and a representation format, with requirements for the bitstream and for the receiver.

Conformance

Part of 3GPP TS 26.265

The conformance functions, among them the conformance validator that tests whether a bitstream conforms to an operation point.

LEARN

Operation points

The seven operation points of TS 26.265, grouped by video format

3GPP-HD

AVC and HEVC

3GPP-AVC-HD: AVC High Progressive Profile, Level 4.0. 3GPP-HEVC-HD: HEVC Main 10 Profile, Main Tier, Level 4.1.

3GPP-HDR

HEVC, HD and UHD

HEVC Main 10 Profile, Main Tier: 3GPP-HEVC-HD-HDR at Level 4.1 and 3GPP-HEVC-UHD-HDR at Level 5.1.

3GPP-STEREO

HEVC and MV-HEVC

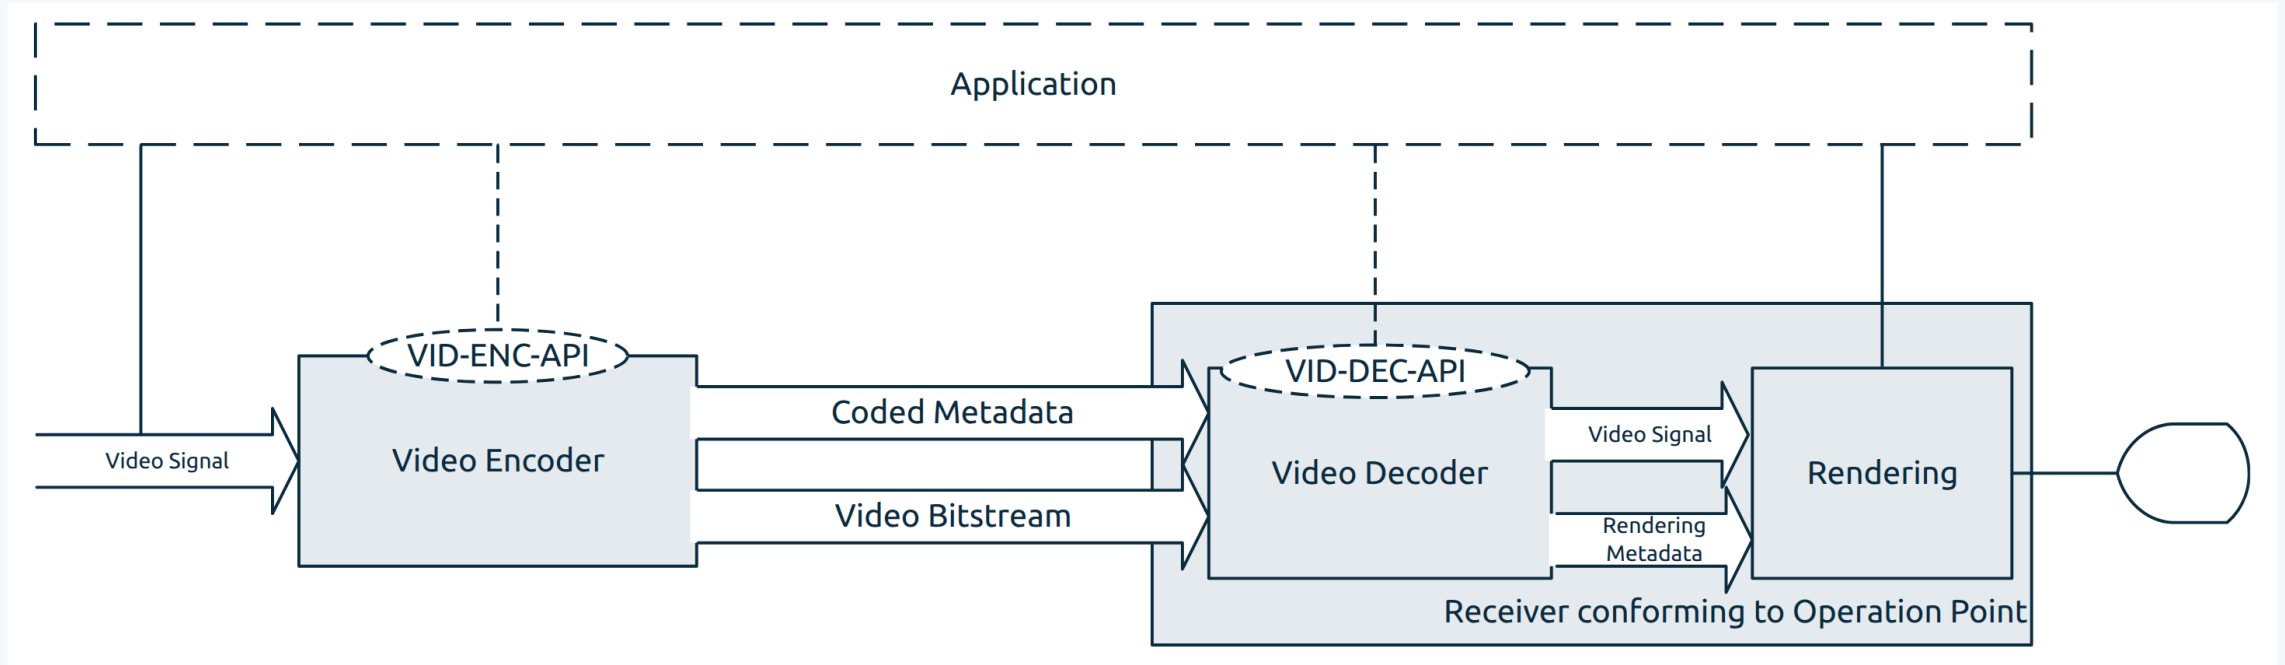

3GPP-HEVC-Stereo: HEVC Main 10 Profile, Main Tier, Level 5.2, frame packed. 3GPP-MV-HEVC-Main-Stereo and 3GPP-MV-HEVC-Ext-Stereo: MV-HEVC, two layers.

An operation point is a collection of discrete combinations of video representation formats: spatial and temporal resolutions, colour mapping, transfer functions and the encoding format.

LEARN

Reference architecture

From a video signal to rendering, in the specification

Redrawn from TS 26.265. The APIs are not normatively specified: they serve as an example reference to configure encoders and decoders.

LEARN

Conformance functions

What the conformance part of TS 26.265 provides

Test material	Validator	Conforming decoders	Conformance bitstreams
Annotated video test signals, and reference encoders with configurations.	Tests bitstreams that claim to conform, and reports which test assertions are not fulfilled.	Return a report and an MD5.	Give a decoder under test a bitstream, and the decoder conformance test its information.

LEARN

How the validator works

It parses a bitstream to XML, then checks the XML against schemas

1 Parse bitstream	2 Generate XML	3 Load XSD schemas	4 Validate
Reads the NAL units of the AVC or HEVC bitstream and parses their headers and parameters.	Creates an XML element for each NAL unit, with its parameters nested by codec structure.	Reads the operation point and loads the XSD 1.1 schemas specified for it.	Runs the XSD validation, extracts which assertions pass or fail and writes the report.

From the repository README. A "shall" requirement that fails is reported as an error, a "should" as a warning.

LEARN

What is still open

Points the specification leaves for further study, which bound the validator

System integration

Definitions for AVC and HEVC

The specification states that the definitions for AVC and for HEVC are for further study.

Encoder API

Mapping of operation points

The mapping of operation points to an encoder API is stated as work for further study.

Validator report

Semantics and format

The detailed semantics and the format of the report are for further study, so the JSON report is the validator's own.

Repositories in the architecture

The Reference Tools on the specification figure, as the figure generator draws them

PROVIDED BY THE REFERENCE TOOLS

1 **vops-conformance-validator**

Only the Conformance Validator is mapped to a repository.

CONTRIBUTE

Latest updates and roadmap

Status on 19 October 2026

PLANNED

Testing with conformance bitstreams

Every operation point is to be tested with its conformance bitstreams, to confirm the schemas and parsers.

Later edition of the specification

The validator is to be rebuilt against the later edition of TS 26.265, which changes the dual-layer HEVC capabilities.
